

ACCREDITED SODABLAST OPERATOR PROGRAM FOR MOTOR ENTHUSIASTS

After six years' of success in supplying soda blasting equipment to automotive restoration suppliers and other industries, Sodablast Australia has launched its Accredited Operator Program (AOP).

"The Program is designed to provide accredited operators with the opportunity to manage their own surface remediation, restoration and preparation business based on the proven efficacy of the Sodablast system. As part of the Program, we also provide a comprehensive support platform", said Kevin Berridge of Sodablast.

"Our long experience with car enthusiasts and a broad range of restoration projects has enabled us identify and understand market needs, as well as financial dynamics and other elements needed for a successful independent Sodablast operator".

"Accredited operators receive full training on their own new equipment, internet and print advertising, personalised stationery and ongoing telephone support."

"The equipment package includes a choice of a Sodablast Pro-Mobile SBHV 150 Single Blaster or SBHV 200 Triple Blaster, a new turbo diesel utility vehicle, protective equipment and initial supplies of sodium bicarbonate blast media."

He said "Sodablast is fast, safe and effective at removing layers of paint and grease from vehicle bodies and engine components. The process also removes mould and mildew from surfaces, cleans and decontaminates food preparation areas, restores the surface of monuments and streetscape objects and remediates and neutralises odours associated with fire and flood. With Sodablast equipment, the operator can adjust the pressure and ratio of blast material, to remove paint from virtually any structural material without causing any defects."

"Sodablast uses an easy to operate, reliable and proven machine that delivers environmentally inert food grade bicarbonate of soda as blasting media. The proprietary design of the machine and components propel soda particles under pressure that fracture on impact, gently but effectively removing stubborn surface coatings without damage to base materials."
