## TRUCK BODY MAKEOVERS NOW A SIMPLE TASK

If you need to respray your truck or just want to clean up your engine, trailer or your mechanical workshop, sodablasting is an effective and environmentally friendly solution.

“Normal stripping techniques on vehicles require sanders and grinders to remove paint from the surface. Such methods usually require two or more days to completely prepare, strip and clean. The non-destructive abrasive characteristic of soda blasting allows vehicles to be completely stripped in just a few hours,” said Kevin Berridge of Sodablast Australia.

“Soda blasting effectively removes paint down to the base without damage to the metal, glass, plastic or aluminium trim on truck cabs. Soda blasting is ideal for stripping all types of vehicles.

The baking soda will not damage or infiltrate hydraulics or engine parts so trucks, containers or earthmoving equipment are simple to prepare for repainting.”

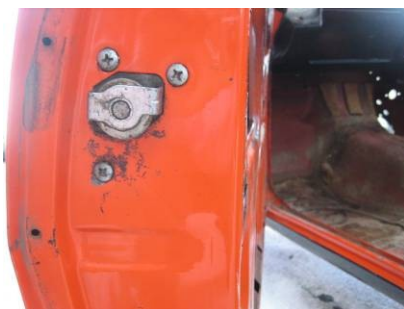

“The process uses safe food grade baking soda as a blast media and leaves a quality ready to paint finish which can be used with no ill effect to the user or the environment.

After hosing down with water the bodywork can be left for weeks without rusting due to the passivation qualities of the sodium bicarbonate. It is very fast and requires little preparation time due to its non-destructive nature.”

A range of Sodablasting units are available, or if you prefer, Sodablast operators will do the job for you,” Kevin said.

Sodablast says all waste is disposed of in accordance with EPA and Council regulations. Geotextiles and drain guards prevent any seepage of removed paint or soda entering the storm water drains and various tenting methods contain any airborne particles.
